Ring Sizers

Using these two sizers, you should be able to determine the American ring size of your ring or your finger! Instructions for using them are below. Print this page on the highest quality setting of your printer. Some printers introduce slight distortions in the sizes of printed pieces. To verify that you have an accurate printout, measure the distances between the ends of the pieces shown below. They should measure the exact distance that is shown next to the figure.

The Ring Sizer

This figure will help you determine the size of a ring that you want to measure. You might want to print it on or glue it to stiff Bristol board. Cut out the sizer on the heavy outside lines. Place the sizer through the finger hole in the ring and read the size that is closest to where the ring rests (make sure both sides are even). Half sizes are indicated by the thin line between sizes.

The Finger Sizer

This figure will help you determine the size of your finger. Print on paper or flexible polyester (make sure that whatever you use is compatible with your printer!). Cut out the sizer on the heavy outside lines. Wrap it around your finger with the lines facing outward. Read your size where the short end meets one of the size markings. Keep in mind that a ring with a wide shank will need to be as much as a size bigger to pass over the knuckle, than one with a thin shank.
